

Thomas Bouzy

Senior Software Engineer — Technical Leadership & Architecture

06 32 13 45 47 · tom.bouzy@gmail.com · Grandrupt, Grand Est (88) · linkedin.com/in/thomas-bouzy

PROFILE

Software engineer with 12 years of experience on highly available transactional systems. Specialized in event-driven backend architecture, migrating systems that never stop running, and technical team leadership. Four years on a platform with 1.5M+ active users, real-time financial flows and third-party financial integrations. Advanced use of coding agents in a professional context and LLM integration on personal projects. Fully remote since 2018.

PROFESSIONAL EXPERIENCE

Senior Backend Engineer / Tech Lead · Socios.com (Chiliz)

May 2022 – April 2026 · 4 years — Fully remote

Global digital sports entertainment platform, 1.5M+ active users (fan tokens, sports engagement).

- Designed an **event-driven** architecture (**outbox pattern**, SNS/SQS) and implemented **Event Sourcing** on wallet flows — 1,000+ financial transactions processed per minute.
- Split business domains into microservices (**DDD**), introduced an **RFC/ADR** process and an **API-first guideline** for cross-team architecture decisions; led three major Symfony migrations on a continuously running production system.
- Full redesign of the trader-facing FanTokens API: endpoints reshaped into domain-oriented contracts with lighter payloads, delivered with no service disruption and no user-visible regression — recurring 500 errors brought to zero, Time To Interactive from 17 s to 3 s.
- Cost ownership on the same scope: data provider cost brought down from €9,000 to €3,000 per year at equivalent data quality, through request batching, bulk-operation endpoints and **bringing part of the data in-house** with an internally developed client reading token information directly on-chain. Runtime footprint reduced by an order of magnitude (container image from 1.7 GB to 200 MB, deployment from roughly fifteen minutes to under 4).
- Rolled out **observability** across all backend services (OpenTelemetry, Datadog, per-service dashboards, alerting), combined with increased frontend test coverage — reported bug volume down from around 20 to 5 per month.
- Real-time gamification (leaderboards, 30,000 events/minute) and sustained load during Fan Token Offerings — peaks of 10–20,000 users within minutes — with load tests designed upfront (BlazeMeter).
- Integrated third-party financial partners (digital asset custodians, exchange protocols), later opened to other teams as a **shared service**.
- **Technical lead** across 2 product squads (up to 6 developers, QA, PO): onboarding, architecture reviews, backend community of practice.

Stack: PHP · Symfony 7 · PHPUnit · Behat · AWS · Kubernetes · Docker · GitLab CI/CD · OpenTelemetry · Datadog

PROFESSIONAL EXPERIENCE (continued)

Lead Backend Developer · Kiss The Bride — Digital agency (Freelance)

January 2018 – April 2022 · 4 years — Remote

Multi-tenant SaaS platform for sales-force engagement through gamification, deployed for large enterprise accounts.

- Rebuilt a Symfony 2.7 / AngularJS monolith with no test coverage into an **API-first architecture** (Symfony 4, **API Platform**) with a React frontend: two migrations run in parallel on a continuously running production system, with test coverage established as a prerequisite.
- **Industrialized multi-tenant deployment**: onboarding a new enterprise account brought down to one day — isolated database per client, initialization wizard built in Node.js and Jenkins orchestration.
- Defined the **API contracts** serving two consumers on separate release cycles, web frontend and mobile application: payload conventions, error taxonomy and API Platform usage guidelines for the team.
- **Real-time** delivery of sales-force rankings and results: Mercure (Server-Sent Events) integration on the API.
- Mentored 4 junior developers over two years, backend **technical referent**: code reviews, testing standards, skill development.

Stack: *Symfony 2.7 → 4 · API Platform · Mercure · React · MariaDB · Node.js · GitLab CI · Jenkins · Docker*

TECHNICAL SKILLS

Languages	PHP (expert), SQL, JavaScript / TypeScript, Shell
Frameworks & API	Symfony (3 to 8), API Platform, Node.js, React
Architecture	DDD, CQRS, Event Sourcing, Event-Driven Architecture, microservices, modular monolith, multi-tenancy
Data & infrastructure	PostgreSQL, MySQL / MariaDB, Redis · AWS, Docker, Kubernetes, GitLab CI/CD, ArgoCD, Jenkins
Quality & observability	PHPUnit, Behat, PHPStan, PHP CS Fixer, BlazeMeter · OpenTelemetry, Datadog
Methods	Agile / Scrum, Kanban, RFC/ADR, code review, mentoring

EARLIER EXPERIENCE (2014 – 2018)

Full Stack Developer · ZOL (2018, 5 months) — Android app for delivery drivers and logistics dashboard designed for low connectivity.

Developer / Consultant · Business & Decision (2014-2016 and 2017) — Multichannel marketing BI platform (MSD France), large-account projects (Sanofi) · Quadra Informatique (2016-2017) — maintenance of a mission-critical industrial application in production.

Freelance engagements · La Cartonnerie (Reims) — functional lead on an artistic management application · Highlife Recordings (Dijon) — full-stack development.

Computer Science Lecturer · University of Reims (2016-2017) — undergraduate teaching.

EDUCATION

DUT in Computer Science (2-year technical university degree) · University of Reims Champagne-Ardenne — 2011-2013

LANGUAGES

French native · English full professional proficiency (C1) · German professional basics (B1)
